

Take a conda test drive at bit.ly/tryconda

Windows, macOS, Linux:
Same commands for all platforms.

For full documentation of any command, add --help to the command.

EXAMPLE: conda create --help

	C1 . 1 . 1
Jettinc	Started

Verify Conda is installed, che	ck version number	conda	info
--------------------------------	-------------------	-------	------

Update Conda to the current version conda update -n base conda

Update all packages to the latest version of

Anaconda. Will install stable and compatible conda update anaconda

versions, not necessarily the very latest.

### Working with Environments

Create a new environment named ENVINAME with	conda createname ENVNAME python=3.6
specific version of Python and packages installed.	"PKG1>7.6" PKG2

Activate a named Conda environment	conda	activate	ENVNAME

Activate a Conda environment at a particular location on disk conda activate /path/to/environment-dir

Deactivate current environment conda deactivate

LENDANAE ::

List all packages and versions in the active environment conda list

List all packages and versions in a named environment conda list --name ENVNAME

List all revisions made within the active environment conda list --revisions

List all revisions made in a specified environment conda list --name ENVNAME --revisions

Restore an environment to a previous revision conda install --name ENVNAME --revision

REV\_NUMBER

Delete an entire environment conda remove --name ENVNAME --all

TIP: Anaconda Navigator is a desktop graphical user interface to manage packages and environments with Conda. With Navigator you do not need to use a terminal to run Conda commands, Jupyter Notebooks, JupyterLab, Spyder, and other tools. Navigator is installed with Anaconda, and may be added with Miniconda.

# Sharing Environments

Make an exact copy of an environment	conda createclone ENVNAMEname NEWENV
Export an environment to a YAML file that can be read on Windows, macOS, and Linux	conda env exportname ENVNAME > envname.yml
Create an environment from YAML file	conda env createfile envname.yml
Create an environment from the file named environment.yml in the current directory	conda env create
Export an environment with exact package versions for one OS	conda listexplicit > pkgs.txt
Create an environment based on exact package versions	conda createname NEWENVfile pkgs.txt

## Using Packages and Channels

Search for a package in currently configured channels with version range >=3.1.0, <3.2"

conda search PKGNAME=3.1 "PKGNAME

Find a package on all channels using the Anaconda

[version='>=3.1.0,<3.2']"

Install package from a specific channel

anaconda search FUZZYNAME

conda install conda-forge::PKGNAME

Install a package by exact version number (3.1.4)

conda install PKGNAME==3.1.4

conda install "PKGNAME[version='3.1.2|3.1.4']"

Install one of the listed versions (OR)

conda install "PKGNAME>2.5,<3.2"

Install following several constraints (AND) Add a channel to your Conda configuration

conda config --add channels CHANNELNAME

Additional Useful Hints

Client

Detailed information about package versions conda search PKGNAME --info

Remove unused cached files including unused packages conda clean --all

Remove a package from an environment conda uninstall PKGNAME --name ENVNAME

Update all packages within an environment conda update --all --name ENVNAME

Run most commands without requiring conda install -- yes PKG1 PKG2 a user prompt. Useful for scripts.

conda config --show

Examine Conda configuration and configuration services

conda config --show-sources
